

## Abstract of the Disclosure

A tissue product that has a relatively low level of lint and slough is provided. For example, the tissue product contains a flexible binder copolymer that is at least formed from an ethylenically unsaturated monomeric constituent and an unsaturated polysiloxane monomeric constituent. In one particular embodiment, the unsaturated polysiloxane monomeric constituent includes at least one unsaturated polysiloxane monomer having the following formula:

wherein,

R<sub>1</sub> is an ethylenically unsaturated group that has free radical polymerizability; R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, and R<sub>8</sub> are the same or different and can be selected from the group consisting of hydrogen, an aryl group, an alkyl group, a substituted alkyl or aryl group, an ethoxy group, and a propoxy group; m is an integer from 4 to 15,000; and n is an integer from 0 to 15,000.
